SOIL CONDITIONER

Special Merloam* Formulation

FOR GARDENS, LAWNS . . .

In only one application, you can condition soil to a depth of 3 inches to 6 inches. There is no need to go back and repeat the treatment in small doses.

inches to 6 inches. There is no need to go back and repeat the treatment in small doses.

One Krilium soil conditioner treatment lasts for years—
Monsanto tests over 3½ years show no diminishing effects during this period. Krilium is a synthetic chemical which quickly turns hard clay and similar "problem" soils into loose, crumbly particles ranging in size from a pinhead to a pea. The result of this action is entirely mechanical—Krilium is not a fertilizer.

Krilium soil conditioner is easy to apply. Merely spread on soil surface, spade in, mix thoroughly, smooth over. Soil is quite porous—therefore admits air readily, gives roots a chance to breathe and spread out.

Krilium soil conditioner is especially useful in building new lawns and in repairing "spotty" lawn areas. In general, it is effective when worked in to a depth of only 3 inches. Procedure is the same as for other applications—work in thoroughly, 40E02.

COATED 16 TIMES LARGER FOR EASY PLANTING

★ Deep, Rich Green All Year ★ Chokes Back Bermuda

* Requires No Mowing

* Resists Rough Usage

* Forms Dense Turf

★ Thrives in Sun and Shade

Dichondra is a low-growing American plant, native to the southeastern part of the United States, from Virginia south. It is known botanically as Dichondra Repens or D. Repens var. Carolinensis. It makes a dense sod by means of runner-like stems, growing very close to the ground, but never forms a thick mat like Bermuda grass. The kidney-shaped leaves, about one-fourth inch wide, and seldom over 1½ inches in height, have a rich, dark velvely-green color. Dichondra is tough in texture and hard usage will not injure the strong turf nor mar its beautiful appearance.

In California and all mild climates dichondra lawns can be started at any time of the year. But as the summer is the best growing season for dichondra, spring or early summer planting gives quickest results. When planting during the colder months, a nurse crop is especially advisable

planting during the color motions, a facts crop as cially advisable.

In the East or Middle West we recommend spring or early summer planting. This allows sufficient time to develop a strong root system and for the plants to make seed. When the foliage and top growth is hurt by rigorous weather the lawn will then renew itself from the roots and self-sown seeds.
